

Inventec introduces Livesense

June 2012

As an additional service to our clients we have developed a dedicated web application called Livesense. It enables our clients, at their convenience, to monitor the structural behaviour of their assets or to control their monitoring projects in real-time. An alarm is raised automatically whenever preset measurement values (often set at more than one subsequent levels) are reached. Livesense is the ideal asset management tool when it comes to Structural Health Monitoring.

See www.livesense.eu. A demo version will be available shortly.
